Recent Revisions to This Document

Release	Changes
April 2019	Added support for tokenized transactions using a network token with 3D Secure or SecureCode. See "Option 1: Merchant Decryption," page 21. Added the following request fields that support tokenized transactions using a network token with 3D Secure or SecureCode (see "API Request Fields," page 45): ■ ccAuthService_directoryServerTransactionID ■ ccAuthService_networkTokenCryptogram ■ ccAuthService_paSpecificationVersion ■ ccSaleService_directoryServerTransactionID ■ ccSaleService_networkTokenCryptogram ■ ccSaleService_paSpecificationVersion Added the following reply fields that support tokenized transactions using a network token with 3D Secure or SecureCode (see "API Reply Fields," page 53): ■ payerAuthEnrollReply_directoryServerTransactionID ■ payerAuthValidateReply_directoryServerTransactionID Added support for the processor *Elavon Americas*. See "Supported Processors, Card Types, and Optional Features," page 17. Added support for merchant-initiated transactions as an optional feature for the following processors (see "Supported Processors, Card Types, and Optional Features," page 17): ■ Chase Paymentech Solutions ■ CyberSource through VisaNet Elavon Americas Added support for subsequent authorizations as an optional feature for the following processors (see "Supported Processors, Card Types, and Optional Features," page 17): ■ FDC Nashville Global ■ JCN Gateway Added support for the following optional features by Elavon Americas (see "Supported Processors, Card Types, and Optional Features," page 17): ■ Multiple partial captures ■ Recurring payments

Release	Changes
March 2019	Added support for the processor *Credit Mutuel-CIC*. See "Supported Processors, Card Types, and Optional Features," page 17. Added support for recurring payments as an optional feature for the processors *Credit Mutuel-CIC* and *SIX*. See "Supported Processors, Card Types, and Optional Features," page 17.
February 2019	Updated the Apple Pay response payload value for the **ccAuthService_commerceIndicator** field. See "Option 1: Merchant Decryption," page 21, and "ccAuthService_commerceIndicator," page 48. Updated the JavaScript for obtaining a Base64-encoded value. See "CyberSource Decryption," page 14.
August 2018	This revision contains only editorial changes and no technical updates.
July 2018	All processors: updated information about optional features. See "Supported Processors, Card Types, and Optional Features," page 17. Added support for the processor *Worldpay VAP*. See "Supported Processors, Card Types, and Optional Features," page 17.

About This Guide

Audience and Purpose

This document is written for merchants who want to use Apple Pay in an iOS application and use information from Apple to process payments through CyberSource. This document provides an overview for integrating Apple and CyberSource services into an order management system.

Conventions

Note and Important Statements

Note

A *Note* contains helpful suggestions or references to material not contained in the document.

Important

An *Important* statement contains information essential to successfully completing a task or learning a concept.

Text and Command Conventions

Convention	Usage
Bold	■ Field and service names in text; for example: Include the **card_accountNumber** field. ■ Items that you are instructed to act upon; for example: Click **Save**.
`Screen text`	■ XML elements. ■ Code examples and samples. ■ Text that you enter in an API environment; for example: Set the **ccAuthService_run** field to `true`.

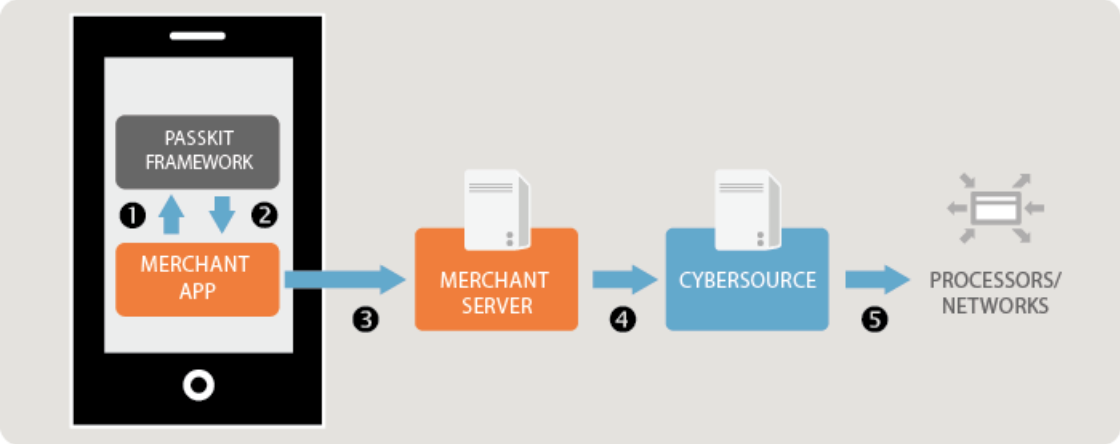
CHAPTER 1

Apple Pay Integrations

In-App Transactions

CyberSource API Integration

Merchant Decryption



1. When the customer chooses to pay with Apple Pay, you use the Apple PassKit Framework to request the encrypted payment data from Apple.

2. Apple uses the Secure Element to create a payment token (the **PKPaymentToken** structure) and encrypt the token's payment data (the **paymentData** field of the **PKPaymentToken** structure) before it sends it your application.

3. You forward the encrypted payment data to your e-commerce back-end system to decrypt. For information on decryption, see:

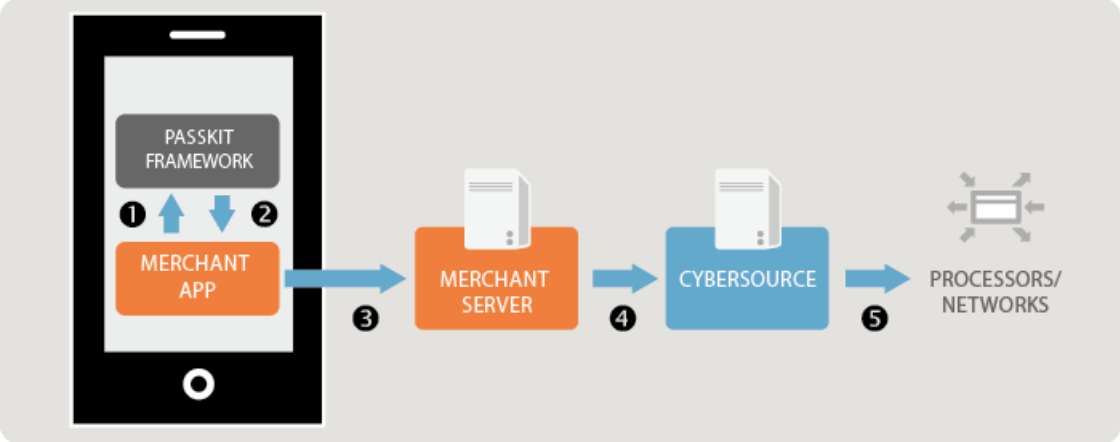
   https://developer.apple.com/library/ios/documentation/PassKit/Reference/PaymentTokenJSON/PaymentTokenJSON.html#//apple_ref/doc/uid/TP40014929-CH8-SW1

4 Using the CyberSource API, you submit the authorization request and include the decrypted payment data. See "Option 1: Merchant Decryption," page 21.

5 CyberSource forwards the information to the payment network, including your processor and the relevant payment card company.

Important You must use the Business Center or one of the CyberSource API services to capture, credit, or void the authorization. See *Credit Card Services Using the Simple Order API*.

CyberSource Decryption



1 When the customer chooses to pay with Apple Pay, you use the Apple PassKit Framework to request the encrypted payment data from Apple.

2 Apple uses the Secure Element to create a payment token (the **PKPaymentToken** structure) and encrypt the token's payment data (the **paymentData** field of the **PKPaymentToken** structure) before it sends it your application.

3 You forward the encrypted payment data to your e-commerce back-end system.

4 Using the CyberSource API, you submit the authorization request. In the **encryptedPayment_data** field include the Base64 encoded value obtained from the **paymentData** field of the **PKPaymentToken** structure. See "Option 2: CyberSource Decryption," page 32.

5 CyberSource decrypts the payment data and forwards the information to the payment network, including your processor and the relevant payment card company.

Important You must use the Business Center or one of the CyberSource API services to capture, credit, or void the authorization. See *Credit Card Services Using the Simple Order API*.

Web Transactions

Integration Types

Merchant Decryption

1 When the customer chooses to pay with Apple Pay, you use the Apple Pay JavaScript to request the encrypted payment data from Apple.

2 Apple uses the Secure Element to create a payment token (the **PKPaymentToken** structure) and encrypt the token's payment data (the **paymentData** field of the **PKPaymentToken** structure) before it sends it your application using the **onpaymentauthorized** callback function.

3 You forward the encrypted payment data to your e-commerce back-end system to decrypt. For information on decryption, see:

https://developer.apple.com/library/ios/documentation/PassKit/Reference/PaymentTokenJSON/PaymentTokenJSON.html#//apple_ref/doc/uid/TP40014929-CH8-SW1

4 Using the CyberSource API, you submit the authorization request and include the decrypted payment data. See "Option 2: CyberSource Decryption," page 32.

5 CyberSource forwards the information to the payment network, including your processor and the relevant payment card company.

Important You must use the Business Center or one of the CyberSource API services to capture, credit, or void the authorization. See *Credit Card Services Using the Simple Order API*.

CyberSource Decryption

1 When the customer chooses to pay with Apple Pay, you use the Apple Pay JavaScript to request the encrypted payment data from Apple.

2 Apple uses the Secure Element to create a payment token (the **PKPaymentToken** structure) and encrypt the token's payment data (the **paymentData** field of the **PKPaymentToken** structure) before it sends it your application via the **onpaymentauthorized** callback function.

3 You forward the encrypted payment data to your e-commerce back-end system.

4 Using the CyberSource API, you submit the authorization request. In the **encryptedPayment_data** field include the Base64 encoded value obtained from the **paymentData** field of the **PKPaymentToken** structure. See "Option 2: CyberSource Decryption," page 32.

5 CyberSource decrypts the payment data and forwards the information to the payment network, including your processor and the relevant payment card company.

Important

You must use the Business Center or one of the CyberSource API services to capture, credit, or void the authorization. See *Credit Card Services Using the Simple Order API.*

Requirements

Important

You must be an *Admin* or *Team Agent* user of your Apple Developer Program account.

For details on each requirement below, see:

https://developer.apple.com/support/apple-pay-domain-verification/

To configure your requirements:

Step 1 Register your merchant ID.

Note

If you are currently processing In-App transactions, you can use the same merchant ID for processing Web transactions.

Step 2 Create or upload a Certificate Signing Request (CSR), which is used to encrypt the payment information during the payment process.

If you are using the merchant decryption method (see "Option 1: Merchant Decryption," page 21), create a CSR.

If you are using the CyberSource decryption method (see "Option 2: CyberSource Decryption," page 32), upload the CSR that you created in the Business Center (see "Enrolling for Apple Pay," page 18).

Note

If you are currently processing In-App transactions, you can use the same CSR for processing Web transactions.

Step 3 Register your domain. Registration is required in order to use Apple Pay on your web site.

Step 4 Create a Merchant Identity Certificate. This certificate is required in order to connect to the Apple servers.

Apple Pay JavaScript

Use the Apple Pay JavaScript to accept Apple Pay payments on your web site. The Apple Pay JavaScript tests that Apple Pay exists on your web site, displays the Apple Pay sheet, and receives the payment token.

Apple Pay Button

Important When a customer clicks or taps an Apple Pay button, it must invoke the Apple Pay payment sheet.

For information on how to use Apple Pay buttons and the button styles, see:

https://developer.apple.com/apple-pay/Apple-Pay-Identity-Guidelines.pdf

You can use CSS templates provided by Apple to display the Apple Pay button on your web site. There are two templates: *logo only* button and *buy with* button. For more information, see Displaying the Apple Pay Button.

ApplePaySession Class

The **ApplePaySession** class manages the payment process on your web site. The **ApplePaySession** object is the entry point for Apple Pay on your web site.

Before displaying the Apple Pay button (see "Apple Pay Button," page 13) or creating an Apple Pay session (see "Create ApplePaySession Object," page 14), ensure that the Apple Pay JavaScript API is available and enabled on the device.

To enable the Apple Pay JavaScript API:

Step 1 Verify that the **window.ApplePaySession** class exists.

Step 2 Call its **canMakePayments** or **canMakePaymentsWithActiveCard** method:

- canMakePayments—verifies that the device is enabled for Apple Pay.
- canMakePaymentsWithActiveCard—verifies that the device is enabled for Apple Pay and the customer has a card stored on the device. You can call this method only if Apple Pay is the default payment method during your checkout flow, or if you want to add the Apple Pay button to your product detail page.

Create ApplePaySession Object

There are two required arguments when creating an **ApplePaySession** object:

- Version number—the API version is 1.
- Payment request—the **PaymentRequest** dictionary contains the information required in order to display the payment form.

When the session is created, call its **begin** method to display the payment form. This method can be called only when invoked by a user's request.

Merchant Validation

When the payment form is displayed, the **onvalidatemerchant** callback function is called and provides a URL to pass to your server for validating the merchant session. Refer to the Merchant Validation section.

Payment Confirmation

When the customer confirms the payment by clicking or tapping the Apple Pay button, the **onpaymentauthorized** callback function is called and provides the payment token.

Merchant Decryption

Forward the encrypted payment data to your e-commerce back-end system to decrypt. For information on decryption, see:

https://developer.apple.com/library/ios/documentation/PassKit/Reference/PaymentTokenJSON/PaymentTokenJSON.html#//apple_ref/doc/uid/TP40014929-CH8-SW1

Using the CyberSource API, submit the authorization request and include the decrypted payment data. See "Option 1: Merchant Decryption," page 21.

CyberSource Decryption

Forward the encrypted payment data to your e-commerce back-end system.

Using the CyberSource API, submit the authorization request. In the **encryptedPayment_data** field include the Base64 encoded value obtained from the **paymentData** object. Example 1 shows the JavaScript for obtaining this value. See "Option 2: CyberSource Decryption," page 32.

Example 1 JavaScript for Obtaining a Base64-Encoded Value

```
session.onpaymentauthorized = function (event) {
var paymentDataString = JSON.stringify(event.payment.token.paymentData);
var paymentDataBase64 = btoa(paymentDataString);
…
}
```

CHAPTER 2

Getting Started

Requirements

- CyberSource account. If you do not already have a CyberSource account, contact your local CyberSource sales representative. You can find your local Sales office here: http://www.cybersource.com/locations/
- Merchant account with a supported processor (see Table 1, "Processors, Card Types, and Optional Features," on page 17).
- You must have an *Admin* or *Team Agent* user of the Apple Pay Developer account.

Important

Apple Pay relies on payment network tokenization. You can sign up for Apple Pay only if both of the following statements are true:

- Your processor supports payment network tokenization.
- CyberSource supports payment network tokenization with your processor.

If one or both of the preceding statements are not true, you must take one of the following actions before you can sign up for Apple Pay:

- Obtain a new merchant account with a processor that supports payment network tokenization.
- Wait until your processor supports payment network tokenization.

Supported Processors, Card Types, and Optional Features

Note All optional features, except split shipments, are described in *Payment Network Tokenization Using the Simple Order API* (PDF | HTML). Split shipments are described in *Credit Card Services Using the Simple Order API* (PDF | HTML).

Table 1 Processors, Card Types, and Optional Features

Processor	Card Types	Optional Features
American Express Direct	American Express	■ Multiple partial captures ■ Recurring payments
Barclays	Visa, Mastercard	■ Multiple partial captures ■ Recurring payments
Chase Paymentech Solutions	Visa, Mastercard, American Express, Discover	■ Merchant-Initiated transactions ■ Multiple partial captures ■ Recurring payments
Credit Mutuel-CIC	■ Visa ■ Mastercard ■ Cartes Bancaires	Recurring Payments
CyberSource through VisaNet. The supported acquirers are: ■ Australia and New Zealand Banking Group Ltd. (ANZ) ■ CitiBank Singapore Ltd. ■ Global Payments Asia Pacific ■ Vantiv ■ Westpac	Visa, Mastercard	■ Merchant-Initiated transactions ■ Recurring payments ■ Split shipments
Elavon Americas	Visa, Mastercard, American Express, JCB, Discover	■ Merchant-Initiated transactions ■ Multiple partial captures ■ Recurring payments
FDC Compass	Visa, Mastercard, American Express	■ Multiple partial captures ■ Recurring payments
FDC Nashville Global	Visa, Mastercard, American Express, Discover	■ Multiple partial captures ■ Recurring payments ■ Subsequent authorizations
GPN	Visa, Mastercard, American Express	■ Recurring payments ■ Split shipments
JCN Gateway	JCB	■ Multiple partial captures ■ Subsequent authorizations

Table 1 Processors, Card Types, and Optional Features (Continued)

Processor	Card Types	Optional Features
OmniPay Direct. The supported acquirers are: ■ Bank of America Merchant Services ■ First Data Merchant Solutions (Europe) ■ Global Payments International Acquiring	Visa, Mastercard	■ Multiple partial captures ■ Recurring payments
SIX	Visa, Mastercard	Recurring Payments
Streamline	Visa, Mastercard	■ Multiple partial captures ■ Recurring payments ■ Subsequent authorizations
TSYS Acquiring Solutions	Visa, Mastercard, American Express	■ Multiple partial captures ■ Recurring payments
Worldpay VAP Worldpay VAP was previously called *Litle*.	Visa, Mastercard	Recurring Payments

Enrolling for Apple Pay

To enroll for Apple Pay:

Step 1 Log in to the Business Center:

- Test transactions: https://ebctest.cybersource.com
- Live transactions: https://ebc.cybersource.com

a Under **Account Management** in the left navigation panel, choose **Digital Payment Solutions**.

b Click **Sign Up**. Follow the steps to verify your account information and accept the agreement on the Apple Pay Developers web site.

Step 2 Generate a Certificate Signing Request (CSR).

a Enter your **Apple Merchant ID** that you registered in the Certificates, Identifiers and Profiles area of the Member Center on the Apple web site.

CyberSource decryption method—Step b and Step c are required.

Merchant decryption method—Step b is required only for saving your Apple Pay merchant ID. The CSR must be obtained directly from Apple.

b Click **Generate CSR** to save your Apple Pay merchant ID and to generate a CSR that is associated with your merchant ID.

c Submit the CSR to Apple.

Go to the Apple web site and upload the CSR. Apple provides you with an Apple Pay Certificate for your Apple Merchant ID. For information about adding certificates to your Apple Merchant ID, see the *PassKit Framework Reference*.

A CSR submitted to Apple expires after 25 months. CyberSource recommends generating and submitting a new CSR prior to the expiration date. See "Generating a New CSR," page 20.

Step 3 Obtain the Apple Pay Certificate.

If you do not have the Apple Pay Certificate, complete the process that is described in the *PassKit Framework Reference*. The Apple Pay Certificate is required for creating an iOS application. The Apple Pay Certificate is not needed for payment processing with CyberSource.

Step 4 Test your software. See "Requesting the Authorization Service," page 21.

If you are using a CyberSource test account, you must connect to the Apple developer system and not to the Apple production system.

After you complete your testing, you must create a new CSR for the CyberSource production system, and you must use that CSR for the Apple production system. Until you perform these steps, you cannot enable payments in your iOS application.

Step 5 Repeat Steps 1, 2, 3, and 5 with your CyberSource production account and the Apple production account.

Generating a New CSR

To generate a new CSR:

Step 1 Log in to the Business Center:

- Test transactions: https://ebctest.cybersource.com
- Live transactions: https://ebc.cybersource.com

Step 2 Under **Account Management** in the left navigation panel, choose **Digital Payment Solutions**.

Step 3 Click **Enabled**.

Step 4 Generate a New CSR:

a Enter the Apple Merchant ID that you registered in the Certificates, Identifiers, and Profiles area of the Member Center on the Apple web site.

b Click **Generate New CSR**.

The new CSR replaces the previous CSR in the list. The previous CSR continues to be active until its expiration date (25 months from the date it was generated.)

c Download and submit the new CSR to Apple.

Single Transaction Report

Go to the Business Center and use the Single Transaction Report to obtain information about your transactions:

- In the Business Center, use the Transaction Search page to identify Apple transactions. You can search for transactions by date, application type, customer name, and other transaction identifiers.
- For information about the Single Transaction Report, see the *Classic Reporting Developer Guide* (PDF | HTML).

CHAPTER 3

Requesting the Authorization Service

Option 1: Merchant Decryption

Visa Transaction

To request an authorization for a Visa transaction:

Note

See the Relaxed Requirements for Address Data and Expiration Date page and "API Request Fields," page 45, for details and field descriptions.

Step 1 Set the **card_accountNumber** field to the payment network token value.

Step 2 Set the **card_expirationMonth** and **card_expirationYear** fields to the values from the payment network token expiration date field.

Step 3 Set the **ccAuthService_cavv** field to the 3D Secure cryptogram of the payment network token.

Step 4 Set the **ccAuthService_networkTokenCryptogram** field to the network token cryptogram.

Step 5 Set the **paymentNetworkToken_transactionType** field to `1`.

Step 6 Set the **ccAuthService_commerceIndicator** field to the ECI value contained in the Apple Pay response payload (`5=vbv` and `7=internet`).

Step 7 Set the **paymentSolution** field to `001`.

Example 2 Authorization Request (Visa)

```
<requestMessage xmlns="urn:schemas-cybersource-com:transaction-data-1.121">
    <merchantID>demomerchant</merchantID>
    <merchantReferenceCode>demorefnum</merchantReferenceCode>
    <billTo>
        <firstName>Jane</firstName>
        <lastName>Smith</lastName>
        <street1>123 Main Street</street1>
        <city>Small Town</city>
        <state>CA</state>
        <postalCode>98765</postalCode>
        <country>US</country>
        <email>jsmith@example.com</email>
    </billTo>
    <purchaseTotals>
        <currency>USD</currency>
        <grandTotalAmount>5.00</grandTotalAmount>
    </purchaseTotals>
    <card>
        <accountNumber>4650100000000839</accountNumber>
        <expirationMonth>12</expirationMonth>
        <expirationYear>2020</expirationYear>
        <cvNumber>123</cvNumber>
        <cardType>001</cardType>
    </card>
    <ccAuthService run="true">
        <cavv>ABCDEFabcdefABCDEFabcdef0987654321234567</cavv>
        <commerceIndicator>internet</commerceIndicator>
    </ccAuthService>
    <paymentNetworkToken>
        <transactionType>1</transactionType>
    </paymentNetworkToken>
    <paymentSolution>001</paymentSolution>
</requestMessage>
```

Example 3 Authorization Response (Visa)

```

</c:replyMessage>
```

Mastercard Transaction

To request an authorization for a Mastercard transaction:

Note See the Relaxed Requirements for Address Data and Expiration Date page and "API Request Fields," page 45, for details and field descriptions.

Step 1 Set the **card_accountNumber** field to the payment network token value.

Step 2 Set the **card_expirationMonth** and **card_expirationYear** fields to the values from the payment network token expiration date field.

Step 3 Set the **ucaf_authenticationData** field to the 3D Secure cryptogram of the payment network token.

Step 4 Set the **ccAuthService_networkTokenCryptogram** field to the network token cryptogram.

Step 5 Set the **ucaf_collectionIndicator** field to 2.

Step 6 Set the **paymentNetworkToken_transactionType** field to 1.

Step 7 Set the **ccAuthService_commerceIndicator** field to ECI value contained in the Apple Pay response payload.

Step 8 Set the **paymentSolution** field to `001`.

Example 4 Authorization Request (Mastercard)

```
<requestMessage xmlns="urn:schemas-cybersource-com:transaction-data-1.121">
    <merchantID>demomerchant</merchantID>
    <merchantReferenceCode>demorefnum</merchantReferenceCode>
    <billTo>
        <firstName>Jane</firstName>
        <lastName>Smith</lastName>
        <street1>123 Main Street</street1>
        <city>Small Town</city>
        <state>CA</state>
        <postalCode>98765</postalCode>
        <country>US</country>
        <email>jsmith@example.com</email>
    </billTo>
    <purchaseTotals>
        <currency>USD</currency>
        <grandTotalAmount>5.00</grandTotalAmount>
    </purchaseTotals>
    <card>
        <accountNumber>5555555555554444</accountNumber>
        <expirationMonth>12</expirationMonth>
        <expirationYear>2020</expirationYear>
        <cvNumber>123</cvNumber>
        <cardType>002</cardType>
    </card>
    <ucaf>
        <authenticationData>ABCDEFabcdefABCDscdef0987654321234567</authenticationData>
        <collectionIndicator>2</collectionIndicator>
    </ucaf>
    <ccAuthService run="true">
        <commerceIndicator>spa</commerceIndicator>
    </ccAuthService>
    <paymentNetworkToken>
        <transactionType>1</transactionType>
    </paymentNetworkToken>
    <paymentSolution>001</paymentSolution>
</requestMessage>
```

Example 5 Authorization Response (Mastercard)

```
<c:replyMessage>
    <c:merchantReferenceCode>demorefnum</c:merchantReferenceCode>
    <c:requestID>4465840340765000001541</c:requestID>
    <c:decision>ACCEPT</c:decision>
    <c:reasonCode>100</c:reasonCode>
    <c:requestToken>Ahj/7wSR5C/4Icd2fdAKakGLadfg5535r/ghx3Z90AoBj3u</c:requestToken>
    <c:purchaseTotals>
        <c:currency>USD</c:currency>
    </c:purchaseTotals>
    <c:ccAuthReply>
        <c:reasonCode>100</c:reasonCode>
        <c:amount>5.00</c:amount>
        <c:authorizationCode>888888</c:authorizationCode>
        <c:avsCode>X</c:avsCode>
        <c:avsCodeRaw>I1</c:avsCodeRaw>
        <c:authorizedDateTime>2015-11-03T20:53:54Z</c:authorizedDateTime>
        <c:processorResponse>100</c:processorResponse>
        <c:reconciliationID>11267051CGJSMQDC</c:reconciliationID>
    </c:ccAuthReply>
</c:replyMessage>
```

American Express Transaction

To request an authorization for an American Express transaction:

Note See the Relaxed Requirements for Address Data and Expiration Date page and "API Request Fields," page 45, for details and field descriptions.

Step 1 Set the **card_accountNumber** field to the payment network token value.

Step 2 Set the **card_expirationMonth** and **card_expirationYear** fields to the values from the payment network token expiration date field.

Step 3 Set the **ccAuthService_cavv** field to the 3D Secure cryptogram of the payment network token.

Important Include the whole 20-byte cryptogram in the **ccAuthService_cavv** field. For a 40-byte cryptogram, split the cryptogram into two 20-byte binary values (block A and block B). Set the **ccAuthService_cavv** field to the block A value and set the **ccAuthService_xid** field to the block B value.

Step 4 Set the **ccAuthService_networkTokenCryptogram** field to the network token cryptogram.

Step 5 Set the **paymentNetworkToken_transactionType** field to `1`.

Step 6 Set the **ccAuthService_commerceIndicator** field to ECI value contained in the Apple Pay response payload.

Step 7 Set the **paymentSolution** field to `001`.

Example 6 Authorization Request (American Express)

```
<requestMessage xmlns="urn:schemas-cybersource-com:transaction-data-1.121">
    <merchantID>demomerchant</merchantID>
    <merchantReferenceCode>demorefnum</merchantReferenceCode>
    <billTo>
        <firstName>Jane</firstName>
        <lastName>Smith</lastName>
        <street1>123 Main Street</street1>
        <city>Small Town</city>
        <state>CA</state>
        <postalCode>98765</postalCode>
        <country>US</country>
        <email>jsmith@example.com</email>
    </billTo>
    <purchaseTotals>
        <currency>USD</currency>
        <grandTotalAmount>5.00</grandTotalAmount>
    </purchaseTotals>
    <card>

</c:replyMessage>
```

Discover Transaction

To request an authorization for a Discover transaction:

Note See the Relaxed Requirements for Address Data and Expiration Date page and "API Request Fields," page 45, for details and field descriptions.

Step 1 Set the **card_accountNumber** field to the payment network token value.

Step 2 Set the **card_expirationMonth** and **card_expirationYear** fields to the values from the payment network token expiration date field.

Step 3 Set the **ccAuthService_cavv** field to the 3D Secure cryptogram of the payment network token.

Step 4 Set the **ccAuthService_networkTokenCryptogram** field to the network token cryptogram.

Step 5 Set the **paymentNetworkToken_transactionType** field to `1`.

Step 6 Set the **ccAuthService_commerceIndicator** field to ECI value contained in the Apple Pay response payload.

Step 7 Set the **paymentSolution** field to `001`.

Example 8 Authorization Request (Discover)

```
<requestMessage xmlns="urn:schemas-cybersource-com:transaction-data-1.121">
    <merchantID>demomerchant</merchantID>
    <merchantReferenceCode>demorefnum</merchantReferenceCode>
    <billTo>
        <firstName>Jane</firstName>
        <lastName>Smith</lastName>
        <street1>123 Main Street</street1>
        <city>Small Town</city>
        <state>CA</state>
        <postalCode>98765</postalCode>
        <country>US</country>
        <email>jsmith@example.com</email>
    </billTo>
    <purchaseTotals>
        <currency>USD</currency>
        <grandTotalAmount>5.00</grandTotalAmount>
    </purchaseTotals>
    <card>
        <accountNumber>6011111111111117</accountNumber>
        <expirationMonth>12</expirationMonth>
        <expirationYear>2020</expirationYear>
        <cvNumber>123</cvNumber>
        <cardType>004</cardType>
    </card>
    <ccAuthService run="true">
        <cavv>ABCDEFabcdefABCDEFabcdef0987654321234567</cavv>
        <commerceIndicator>dipb</commerceIndicator>
    </ccAuthService>
    <paymentNetworkToken>
        <transactionType>1</transactionType>
    </paymentNetworkToken>
    <paymentSolution>001</paymentSolution>
</requestMessage>
```

Example 9 Authorization Response (Discover)

```
<c:replyMessage>
    <c:merchantReferenceCode>demorefnum</c:merchantReferenceCode>
    <c:requestID>4465840340765000001541</c:requestID>
    <c:decision>ACCEPT</c:decision>
    <c:reasonCode>100</c:reasonCode>
    <c:requestToken>Ahj/7wSR5C/4Icd2fdAKakGLadfg5535r/ghx3Z90AoBj3u</c:requestToken>
    <c:purchaseTotals>
        <c:currency>USD</c:currency>
    </c:purchaseTotals>
    <c:ccAuthReply>

</c:replyMessage>
```

JCB Transaction

To request an authorization for a JCB transaction:

Note See the Relaxed Requirements for Address Data and Expiration Date page and "API Request Fields," page 45, for details and field descriptions.

Step 1 Set the **card_accountNumber** field to the payment network token value.

Step 2 Set the **cardexpiration_Month** and **card_expirationYear** fields to the values from the payment network token expiration date field.

Step 3 Set the **ccAuthService_cavv** field to the 3D Secure cryptogram of the payment network token.

Step 4 Set the **paymentNetworkToken_transactionType** field to `1`.

Step 5 Set the **eciraw** field to the ECI value contained in the Apple Pay response payload.

Step 6 Set the **PaymentSolution** field to `001`.

Example 10 Authorization Request (JCB)

```
<requestMessage xmlns="urn:schemas-cybersource-com:transaction-data-1.121">
   <merchantID>demomerchant</merchantID>
   <merchantReferenceCode>demorefnum</merchantReferenceCode>
   <billTo>
      <firstName>Jane</firstName>
      <lastName>Smith</lastName>
      <street1>123 Main Street</street1>
      <city>Small Town</city>
      <state>CA</state>
      <postalCode>98765</postalCode>
      <country>US</country>
      <email>jsmith@example.com</email>
   </billTo>
   <purchaseTotals>
      <currency>USD</currency>
      <grandTotalAmount>5.00</grandTotalAmount>
   </purchaseTotals>
   <card>
      <accountNumber>3566111111111113</accountNumber>
      <expirationMonth>12</expirationMonth>
      <expirationYear>2020</expirationYear>
      <cvNumber>123</cvNumber>
      <cardType>001</cardType>
   </card>
   <ccAuthService run="true">
      <cavv>ABCDEFabcdefABCDEFabcdef0987654321234567</cavv>
      <eciRaw>5</eciRaw>
   </ccAuthService>
   <paymentNetworkToken>
      <transactionType>1</transactionType>
   </paymentNetworkToken>
   <paymentSolution>001</paymentSolution>
</requestMessage>
```

```

Option 2: CyberSource Decryption

Visa Transaction

To request an authorization for a Visa transaction:

Note

See the Relaxed Requirements for Address Data and Expiration Date page and "API Request Fields," page 45, for details and field descriptions.

Step 1 Set the **encryptedPayment_data** field to the Base64 encoded value obtained from the **paymentData** property of the **PKPaymentToken** object. See page 10.

Step 2 Set the **encryptedPayment_descriptor** field to:
`RklEPUNPTU1PTi5BUFBMRS5JTkFQUC5QQVlNRU5U`

Step 3 Set the **paymentSolution** field to `001`.

Example 14 Authorization Request (Visa)

```
<requestMessage xmlns="urn:schemas-cybersource-com:transaction-data-1.121">
    <merchantID>demomerchant</merchantID>
    <merchantReferenceCode>demorefnum</merchantReferenceCode>
    <billTo>
        <firstName>Jane</firstName>
        <lastName>Smith</lastName>
        <street1>123 Main Street</street1>
        <city>Small Town</city>
        <state>CA</state>
        <postalCode>98765</postalCode>
        <country>US</country>
        <email>jsmith@example.com</email>
    </billTo>
    <purchaseTotals>
        <currency>USD</currency>
        <grandTotalAmount>5.00</grandTotalAmount>
    </purchaseTotals>
    <encryptedPayment>
        <descriptor>RklEPUNPTU1PTi5BUFBMRS5JTkFQUC5QQVlNRU5U</descriptor>
        <data>ABCDEFabcdefABCDEFabcdef0987654321234567</data>
        <encoding>Base64</encoding>
    </encryptedPayment>
    <card>
        <cardType>001</cardType>
    </card>
    <ccAuthService run="true"/>
    <paymentSolution>001</paymentSolution>
</requestMessage>
```

Example 15 Authorization Response (Visa)

```
<c:replyMessage>
    <c:merchantReferenceCode>demorefnum</c:merchantReferenceCode>
    <c:requestID>4465840340765000001541</c:requestID>
    <c:decision>ACCEPT</c:decision>
    <c:reasonCode>100</c:reasonCode>
    <c:requestToken>Ahj/7wSR5C/4Icd2fdAKakGLadfg5535r/ghx3Z90AoBj3u</c:requestToken>
    <c:token>
        <c:expirationMonth>07</c:expirationMonth>
        <c:expirationYear>2025</c:expirationYear>
        <c:prefix>239845</c:prefix>
        <c:suffix>2947</c:suffix>
    </c:token>
    </c:purchaseTotals>
    <c:purchaseTotals>
        <c:currency>USD</c:currency>
    </c:purchaseTotals>
    <c:ccAuthReply>
        <c:reasonCode>100</c:reasonCode>
        <c:amount>5.00</c:amount>
        <c:authorizationCode>888888</c:authorizationCode>
        <c:avsCode>X</c:avsCode>
        <c:avsCodeRaw>I1</c:avsCodeRaw>
        <c:authorizedDateTime>2015-11-03T20:53:54Z</c:authorizedDateTime>
        <c:processorResponse>100</c:processorResponse>
        <c:reconciliationID>11267051CGJSMQDC</c:reconciliationID>
    </c:ccAuthReply>
</c:replyMessage>
```

Mastercard Transaction

To request an authorization for a Mastercard transaction:

Note

See the Relaxed Requirements for Address Data and Expiration Date page and "API Request Fields," page 45, for details and field descriptions.

Step 1 Set the **encryptedPayment_data** field to the Base64 encoded value obtained from the **paymentData** property of the **PKPaymentToken** object. See page 10.

Step 2 Set the **encryptedPayment_descriptor** field to:
`RklEPUNPTU1PTi5BUFBMRS5JTkFQUC5QQVlNRU5U`

Step 3 Set the **paymentSolution** field to `001`.

Example 16 Authorization Request (Mastercard)

```
<requestMessage xmlns="urn:schemas-cybersource-com:transaction-data-1.121">
    <merchantID>demomerchant</merchantID>
    <merchantReferenceCode>demorefnum</merchantReferenceCode>
    <billTo>
        <firstName>Jane</firstName>
        <lastName>Smith</lastName>
        <street1>123 Main Street</street1>
        <city>Small Town</city>
        <state>CA</state>
        <postalCode>98765</postalCode>
        <country>US</country>
        <email>jsmith@example.com</email>
    </billTo>
    <purchaseTotals>
        <currency>USD</currency>
        <grandTotalAmount>5.00</grandTotalAmount>
    </purchaseTotals>
    <encryptedPayment>
        <descriptor>RklEPUNPTU1PTi5BUFBMRS5JTkFQUC5QQVlNRU5U</descriptor>
        <data>ABCDEFabcdefABCDEFabcdef0987654321234567</data>
        <encoding>Base64</encoding>
    </encryptedPayment>
    <card>
        <cardType>002</cardType>
    </card>
    <ccAuthService run="true"/>
    <paymentSolution>001</paymentSolution>
</requestMessage>
```

Example 17 Authorization Response (Mastercard)

```
<c:replyMessage>
    <c:merchantReferenceCode>demorefnum</c:merchantReferenceCode>
    <c:requestID>4465840340765000001541</c:requestID>
    <c:decision>ACCEPT</c:decision>
    <c:reasonCode>100</c:reasonCode>
    <c:requestToken>Ahj/7wSR5C/4Icd2fdAKakGLadfg5535r/ghx3Z90AoBj3u</c:requestToken>
    <c:token>
        <c:expirationMonth>07</c:expirationMonth>
        <c:expirationYear>2025</c:expirationYear>
        <c:prefix>239845</c:prefix>
        <c:suffix>2947</c:suffix>
    </c:token>
    <c:purchaseTotals>
        <c:currency>USD</c:currency>
    </c:purchaseTotals>
    <c:ccAuthReply>
        <c:reasonCode>100</c:reasonCode>
        <c:amount>5.00</c:amount>
        <c:authorizationCode>888888</c:authorizationCode>
        <c:avsCode>X</c:avsCode>
        <c:avsCodeRaw>I1</c:avsCodeRaw>
        <c:authorizedDateTime>2015-11-03T20:53:54Z</c:authorizedDateTime>
        <c:processorResponse>100</c:processorResponse>
        <c:reconciliationID>11267051CGJSMQDC</c:reconciliationID>
    </c:ccAuthReply>
</c:replyMessage>
```

American Express Transaction

To request an authorization for an American Express transaction:

Note

See the Relaxed Requirements for Address Data and Expiration Date page and "API Request Fields," page 45, for details and field descriptions.

Step 1 Set the **encryptedPayment_data** field to the Base64 encoded value obtained from the **paymentData** property of the **PKPaymentToken** object. See page 10.

Step 2 Set the **encryptedPayment_descriptor** field to:
`RklEPUNPTU1PTi5BUFBMRS5JTkFQUC5QQVlNRU5U`

Step 3 Set the **paymentSolution** field to `001`.

Example 18 Authorization Request (American Express)

```
<requestMessage xmlns="urn:schemas-cybersource-com:transaction-data-1.121">
    <merchantID>demomerchant</merchantID>
    <merchantReferenceCode>demorefnum</merchantReferenceCode>
    <billTo>
        <firstName>Jane</firstName>
        <lastName>Smith</lastName>
        <street1>123 Main Street</street1>
        <city>Small Town</city>
        <state>CA</state>
        <postalCode>98765</postalCode>
        <country>US</country>
        <email>jsmith@example.com</email>
    </billTo>
    <purchaseTotals>
        <currency>USD</currency>
        <grandTotalAmount>5.00</grandTotalAmount>
    </purchaseTotals>
    <encryptedPayment>
        <descriptor>RklEPUNPTU1PTi5BUFBMRS5JTkFQUC5QQVlNRU5U</descriptor>
        <data>ABCDEFabcdefABCDEFabcdef0987654321234567</data>
        <encoding>Base64</encoding>
    </encryptedPayment>
    <card>
        <cardType>003</cardType>
    </card>
    <ccAuthService run="true"/>
    <paymentSolution>001</paymentSolution>
</requestMessage>
```

Example 19 Authorization Response (American Express)

```
<c:replyMessage>
    <c:merchantReferenceCode>demorefnum</c:merchantReferenceCode>
    <c:requestID>4465840340765000001541</c:requestID>
    <c:decision>ACCEPT</c:decision>
    <c:reasonCode>100</c:reasonCode>
    <c:requestToken>Ahj/7wSR5C/4Icd2fdAKakGLadfg5535r/ghx3Z90AoBj3u</c:requestToken>
    <c:token>
        <c:expirationMonth>07</c:expirationMonth>
        <c:expirationYear>2025</c:expirationYear>
        <c:prefix>239845</c:prefix>
        <c:suffix>2947</c:suffix>
    </c:token>
    <c:purchaseTotals>
        <c:currency>USD</c:currency>
    </c:purchaseTotals>
    <c:ccAuthReply>

        <c:authorizationCode>888888</c:authorizationCode>
        <c:avsCode>X</c:avsCode>
        <c:avsCodeRaw>I1</c:avsCodeRaw>
        <c:authorizedDateTime>2015-11-03T20:53:54Z</c:authorizedDateTime>
        <c:processorResponse>100</c:processorResponse>
        <c:reconciliationID>11267051CGJSMQDC</c:reconciliationID>
    </c:ccAuthReply>
</c:replyMessage>
```

Discover Transaction

To request an authorization for a Discover transaction:

Note

See the Relaxed Requirements for Address Data and Expiration Date page and "API Request Fields," page 45, for details and field descriptions.

Step 1 Set the **encryptedPayment_data** field to the Base64 encoded value obtained from the **paymentData** property of the **PKPaymentToken** object. See page 10.

Step 2 Set the **encryptedPayment_descriptor** field to: `RklEPUNPTU1PTi5BUFBMRS5JTkFQUC5QQVlNRU5U`

Step 3 Set the **paymentSolution** field to `001`.

Example 20 Authorization Request (Discover)

```
<requestMessage xmlns="urn:schemas-cybersource-com:transaction-data-1.121">
    <merchantID>demomerchant</merchantID>
    <merchantReferenceCode>demorefnum</merchantReferenceCode>
    <billTo>
        <firstName>Jane</firstName>
        <lastName>Smith</lastName>
        <street1>123 Main Street</street1>
        <city>Small Town</city>
        <state>CA</state>
        <postalCode>98765</postalCode>
        <country>US</country>
        <email>jsmith@example.com</email>
    </billTo>
    <purchaseTotals>
        <currency>USD</currency>
        <grandTotalAmount>5.00</grandTotalAmount>
    </purchaseTotals>
    <encryptedPayment>
        <descriptor>RklEPUNPTU1PTi5BUFBMRS5JTkFQUC5QQVlNRU5U</descriptor>
        <data>ABCDEFabcdefABCDEFabcdef0987654321234567</data>
        <encoding>Base64</encoding>
    </encryptedPayment>
    <card>
        <cardType>004</cardType>
    </card>
    <paymentNetworkToken>
        <transactionType>1</transactionType>
    </paymentNetworkToken>
    <paymentSolution>001</paymentSolution>
    <ccAuthService run="true"/>
</requestMessage>
```

Example 21 Authorization Response (Discover)

```
<c:replyMessage>
    <c:merchantReferenceCode>demorefnum</c:merchantReferenceCode>

</c:replyMessage>
```

JCB Transaction

To request an authorization for a JCB transaction:

Note

See the Relaxed Requirements for Address Data and Expiration Date page and "API Request Fields," page 45, for details and field descriptions.

Step 1 Set the **encryptedPayment_data** field to the base64 encoded value obtained from the **paymentData** property of the **PKPaymentToken** object.

Step 2 Set the **encryptedPaymentdescriptor** field to `RklEPUNPTU1PTi5BUFBMRS5JTkFQUC5QQVlNRU5U`.

Step 3 Set the **paymentSolution** field to `001`.

Example 22 Authorization Request (JCB)

```
<requestMessage xmlns="urn:schemas-cybersource-com:transaction-data-1.121">
    <merchantID>demomerchant</merchantID>
    <merchantReferenceCode>demorefnum</merchantReferenceCode>
    <billTo>
        <firstName>Jane</firstName>
        <lastName>Smith</lastName>
        <street1>123 Main Street</street1>
        <city>Small Town</city>
        <state>CA</state>
        <postalCode>98765</postalCode>
        <country>US</country>
        <email>jsmith@example.com</email>
   </billTo>
   <purchaseTotals>
        <currency>USD</currency>
        <grandTotalAmount>5.00</grandTotalAmount>
   </purchaseTotals>
   <encryptedPayment>
        <descriptor>RklEPUNPTU1PTi5BUFBMRS5JTkFQUC5QQVlNRU5U</descriptor>
        <data>ABCDEFabcdefABCDEFabcdef0987654321234567</data>
        <encoding>Base64</encoding>
   </encryptedPayment>
   <card>
    <cardType>001</cardType>
   </card>
   <ccAuthService run="true"/>
    <paymentSolution>001</paymentSolution>
</requestMessage>
```

Example 23 Authorization Reply (JCB)

```
<c:replyMessage>
   <c:merchantReferenceCode>demorefnum</c:merchantReferenceCode>
   <c:requestID>4465840340765000001541</c:requestID>
   <c:decision>ACCEPT</c:decision>
   <c:reasonCode>100</c:reasonCode>
   <c:requestToken>Ahj/7wSR5C/4Icd2fdAKakGLadfg5535r/ghx3Z90AoBj3u</
   c:requestToken>
   <c:token>
      <c:expirationMonth>07</c:expirationMonth>
      <c:expirationYear>2025</c:expirationYear>
      <c:prefix>239845</c:prefix>
      <c:suffix>2947</c:suffix>
   </c:token>
   <c:purchaseTotals>
      <c:currency>USD</c:currency>
   </c:purchaseTotals>
   <c:ccAuthReply>
      <c:reasonCode>100</c:reasonCode>
      <c:amount>5.00</c:amount>
      <c:authorizationCode>888888</c:authorizationCode>

   </c:ccAuthReply>
   </c:replyMessage>
```

Additional CyberSource Services

For information on how to request these follow-on services, refer to *Credit Card Services Using the Simple Order API*.

Table 2 CyberSource Services

CyberSource Service	Description
Capture	A follow-on service that uses the request ID returned from the previous authorization. The request ID links the capture to the authorization. This service transfers funds from the customer's account to your bank and usually takes two to four days to complete.
Sale	A sale is a bundled authorization and capture. Request the authorization and capture services at the same time. CyberSource processes the capture immediately.
Auth Reversal	A follow-on service that uses the request ID returned from the previous authorization. An auth reversal releases the hold that the authorization placed on the customer's credit card funds. Use this service to reverse an unnecessary or undesired authorization.

APPENDIX A

API Fields

Data Type Definitions

For more information about these data types, see the World Wide Web Consortium (W3C) XML Schema Part 2: Datatypes Second Edition.

Table 3 Data Type Definitions

Data Type	Description
Integer	Whole number {..., -3, -2, -1, 0, 1, 2, 3, ...}
String	Sequence of letters, numbers, spaces, and special characters

Numbered Elements

The CyberSource XML schema includes several numbered elements. You can include these complex elements more than once in a request. For example, when a customer order includes more than one item, you must include multiple `<item>` elements in your request. Each item is numbered, starting with `0`. The XML schema uses an `id` attribute in the item's opening tag to indicate the number. For example:

```
<item id="0">
```

As a name-value pair field name, this tag is represented as **item_0**. In this portion of the field name, the underscore before the number does not indicate hierarchy in the XML schema. The item fields are generically referred to as **item_#_<element name>** in the documentation.

Below is an example of the numbered <item> element and the corresponding name-value pair field names. If you are using SOAP, the client contains a corresponding Item class.

Example 24 Numbered XML Schema Element Names and Name-Value Pair Field Names

XML Schema Element Names	Corresponding Name-Value Pair Field Names
<item id="0"> <unitPrice> <quantity> </item>	**item_0_unitPrice** **item_0_quantity**
<item id="1"> <unitPrice> <quantity> </item>	**item_1_unitPrice** **item_1_quantity**

Important When a request is in XML format and includes an <item> element, the element must include an id attribute. For example: <item id="0">.

Relaxed Requirements for Address Data and Expiration Date

To enable relaxed requirements for address data and expiration date, contact CyberSource Customer Support to have your account configured for this feature. For details about relaxed requirements, see the Relaxed Requirements for Address Data and Expiration Date page.

API Request Fields

Note

Unless otherwise noted, all field names are case sensitive and all fields accept special characters such as `@`, `#`, and `%`.

Table 4 Request Fields

Field	Description	Used By: Required (R) or Optional (O)	Data Type (Length)
billTo_city	City of the billing address.	ccAuthService (R)[2]	String (50)
billTo_country	Country of the billing address. Use the two-character *ISO Standard Country Codes*.	ccAuthService (R)[2]	String (2)
billTo_email	Customer's email address.	ccAuthService (R)[2]	String (255)
billTo_firstName	Customer's first name. For a credit card transaction, this name must match the name on the card.	ccAuthService (R)[2]	String (60)
billTo_lastName	Customer's last name. For a credit card transaction, this name must match the name on the card.	ccAuthService (R)[2]	String (60)
billTo_phoneNumber	Customer's phone number. CyberSource recommends that you include the country code when the order is from outside the U.S.	ccAuthService (O)	String (15)

1 The TC 33 Capture file contains information about the purchases and refunds that a merchant submits to CyberSource. CyberSource through VisaNet creates the TC 33 Capture file at the end of the day and sends it to the merchant's acquirer, who uses this information to facilitate end-of-day clearing processing with payment card companies.

2 This field is optional if your CyberSource account is configured for relaxed requirements for address data and expiration date. See "Relaxed Requirements for Address Data and Expiration Date," page 44. **Important** It is your responsibility to determine whether a field is required for the transaction you are requesting.

Table 4 Request Fields (Continued)

Field	Description	Used By: Required (R) or Optional (O)	Data Type (Length)
billTo_postalCode	Postal code for the billing address. The postal code must consist of 5 to 9 digits. When the billing country is the U.S., the 9-digit postal code must follow this format: [5 digits][dash][4 digits] **Example** 12345-6789 When the billing country is Canada, the 6-digit postal code must follow this format: [alpha][numeric][alpha][space] [numeric][alpha][numeric] **Example** A1B 2C3	ccAuthService (R)[2]	String (9)
billTo_state	State or province of the billing address. For an address in the U.S. or Canada, use the *State, Province, and Territory Codes for the United States and Canada*.	ccAuthService (R)[2]	String (2)
billTo_street1	First line of the billing street address.	ccAuthService (R)[2]	String (60)
billTo_street2	Additional address information. **Example** Attention: Accounts Payable	ccAuthService (O)	String (60)
card_accountNumber	The payment network token value.	ccAuthService (R)	Nonnegative integer (20)
card_cardType	Type of card to authorize. Possible values: ■ `001`: Visa ■ `002`: Mastercard ■ `003`: American Express ■ `004`: Discover	ccAuthService (R)	String (3)
card_cvNumber	CVN.	ccAuthService (R)	Nonnegative integer (4)
card_expirationMonth	Two-digit month in which the payment network token expires. Format: MM. Possible values: `01` through `12`.	ccAuthService (R)	String (2)

1 The TC 33 Capture file contains information about the purchases and refunds that a merchant submits to CyberSource. CyberSource through VisaNet creates the TC 33 Capture file at the end of the day and sends it to the merchant's acquirer, who uses this information to facilitate end-of-day clearing processing with payment card companies.

2 This field is optional if your CyberSource account is configured for relaxed requirements for address data and expiration date. See "Relaxed Requirements for Address Data and Expiration Date," page 44. **Important** It is your responsibility to determine whether a field is required for the transaction you are requesting.

Table 4 Request Fields (Continued)

Field	Description	Used By: Required (R) or Optional (O)	Data Type (Length)
card_expirationYear	Four-digit year in which the payment network token expires. Format: YYYY.	ccAuthService (R)	Nonnegative integer (4)
ccAuthService_cavv	***Visa*** Cryptogram for payment network tokenization transactions. The value for this field must be 28-character Base64 or 40-character hex binary. All cryptograms use one of these formats. ***American Express*** For a 20-byte cryptogram, set this field to the cryptogram for payment network tokenization transactions. For a 40-byte cryptogram, set this field to block A of the cryptogram for payment network tokenization transactions. The value for this field must be 28-character Base64 or 40-character hex binary. All cryptograms use one of these formats. ***Discover*** Cryptogram for payment network tokenization transactions. The value for this field can be a 20 or 40-character hex binary. All cryptograms use one of these formats. ***CyberSource through VisaNet*** The value for this field corresponds to the following data in the TC 33 capture file[1]: ■ Record: CP01 TCR8 ■ Position: 77-78 ■ Field: CAVV version and authentication action.	ccAuthService (R)	String (40)

1 The TC 33 Capture file contains information about the purchases and refunds that a merchant submits to CyberSource. CyberSource through VisaNet creates the TC 33 Capture file at the end of the day and sends it to the merchant's acquirer, who uses this information to facilitate end-of-day clearing processing with payment card companies.

2 This field is optional if your CyberSource account is configured for relaxed requirements for address data and expiration date. See "Relaxed Requirements for Address Data and Expiration Date," page 44. **Important** It is your responsibility to determine whether a field is required for the transaction you are requesting.

Table 4 Request Fields (Continued)

Field	Description	Used By: Required (R) or Optional (O)	Data Type (Length)
ccAuthService_ commerceIndicator	For a payment network tokenization transaction. The values are required for the merchant decryption method (see "Option 1: Merchant Decryption," page 21). Possible values: ▪ `aesk`: American Express card type ▪ `spa`: Mastercard card type ▪ `vbv`: Visa card type mapped for Apple Pay transactions with eCommerce commerce indicator of 5 `internet`: Visa card type mapped for Apple Pay transactions with eCommerce commerce indicator of 7 ▪ `dipb`: Discover card type	ccAuthService (See description)	String (20)
ccAuthService_ directoryServerTransactionID	Identifier generated during the authentication transaction by the Mastercard Directory Server and passed back with the authentication results.	ccAuthService (O)	String (36)
ccAuthService_eciRaw	Raw electronic commerce indicator (ECI).	ccAuthService (O)	String (2)
ccAuthService_ networkTokenCryptogram	Token authentication verification value cryptogram. For token-based transactions with 3D Secure or SecureCode, you must submit both types of cryptograms: network token and 3D Secure/ SecureCode. The value for this field must be 28-character Base64 or 40-character hex binary. All cryptograms use one of these formats.	ccAuthService (O)	String (40)
ccAuthService_ paSpecificationVersion	The 3D Secure version that you used for Secured Consumer Authentication (SCA); for example, 3D Secure 1.0.2 or 2.0.0.	ccAuthService (O)	String (20)
ccAuthService_run	Whether to include **ccAuthService** in your request. Possible values: ▪ TRUE: Include the service in your request. ▪ FALSE (default): Do not include the service in your request.	ccAuthService (R)	

1 The TC 33 Capture file contains information about the purchases and refunds that a merchant submits to CyberSource. CyberSource through VisaNet creates the TC 33 Capture file at the end of the day and sends it to the merchant's acquirer, who uses this information to facilitate end-of-day clearing processing with payment card companies.

2 This field is optional if your CyberSource account is configured for relaxed requirements for address data and expiration date. See "Relaxed Requirements for Address Data and Expiration Date," page 44. **Important** It is your responsibility to determine whether a field is required for the transaction you are requesting.

Table 4 Request Fields (Continued)

Field	Description	Used By: Required (R) or Optional (O)	Data Type (Length)
ccAuthService_xid	***Visa*** Cryptogram for payment network tokenization transactions. The value for this field must be 28-character Base64 or 40-character hex binary. All cryptograms use one of these formats. ***American Express*** For a 20-byte cryptogram, set this field to the cryptogram for payment network tokenization transactions. For a 40-byte cryptogram, set this field to block A of the cryptogram for payment network tokenization transactions (see page 25). The value for this field must be 28-character Base64 or 40-character hex binary. All cryptograms use one of these formats.	ccAuthService (R)	String (40)
ccSaleService_ directoryServerTransactionID	Identifier generated during the authentication transaction by the Mastercard Directory Server and passed back with the authentication results.	ccSaleService (O)	String (36)
ccSaleService_ networkTokenCryptogram	TAVV token and 3D Secure CAVV cardholder authentication cryptograms. For token-based transactions with 3D Secure, you must submit both types of cryptograms.	ccSaleService (O)	String Base64 (28) or Hex Binary (40)
ccSaleService_ paSpecificationVersion	The 3D Secure version that you used for Secured Consumer Authentication (SCA); for example, 3D Secure 1.0.2 or 2.0.0.	ccSaleService (O)	String (20)
encryptedPayment_data	The encrypted payment data value. Populate this field with the encrypted payment data value obtained from the **paymentData** property of the **PKPaymentToken** object. See the *PassKit Framework Reference*.	ics_auth (R)	
encryptedPayment_ descriptor	Format of the encrypted payment data. The value for Apple Pay is: `RklEPUNPTU1PTi5BUFBMRS5JTkFQUC5QQVlNRU5U`	ics_auth (R)	String (128)
encryptedPayment_ encoding	Encoding method used to encrypt the payment data: `Base64`	ics_auth (R)	String (6)

1 The TC 33 Capture file contains information about the purchases and refunds that a merchant submits to CyberSource. CyberSource through VisaNet creates the TC 33 Capture file at the end of the day and sends it to the merchant's acquirer, who uses this information to facilitate end-of-day clearing processing with payment card companies.

2 This field is optional if your CyberSource account is configured for relaxed requirements for address data and expiration date. See "Relaxed Requirements for Address Data and Expiration Date," page 44. **Important** It is your responsibility to determine whether a field is required for the transaction you are requesting.

Table 4 Request Fields (Continued)

Field	Description	Used By: Required (R) or Optional (O)	Data Type (Length)
item_#_productCode	Type of product. This value is used to determine the product category: electronic, handling, physical, service, or shipping. The default is `default`. See "Numbered Elements," page 43.	ccAuthService (O)	String (255)
item_#_productName	Name of the product. This field is required when the **item_#_productCode** value is not `default` or one of the values related to shipping and/or handling. See "Numbered Elements," page 43.	ccAuthService (See description)	String (255)
item_#_productSKU	Identification code for the product. This field is required when the **item_#_productCode** value is not `default` or one of the values related to shipping and/or handling. See "Numbered Elements," page 43.	ccAuthService (See description)	String (255)
item_#_quantity	The default is 1. This field is required when the **item_#_productCode** value is not `default` or one of the values related to shipping and/or handling. See "Numbered Elements," page 43.	ccAuthService (See description)	Integer (10)
item_#_taxAmount	Total tax to apply to the product. This value cannot be negative. See "Numbered Elements," page 43.	ccAuthService (See description)	String (15)
item_#_unitPrice	Per-item price of the product. This value cannot be negative.You can include a decimal point (.), but you cannot include any other special characters. See "Numbered Elements," page 43.	ccAuthService (See description)	String (15)
merchantID	Your CyberSource merchant ID. Use the same merchant ID for evaluation, testing, and production.	ccAuthService (R)	String (30)

1 The TC 33 Capture file contains information about the purchases and refunds that a merchant submits to CyberSource. CyberSource through VisaNet creates the TC 33 Capture file at the end of the day and sends it to the merchant's acquirer, who uses this information to facilitate end-of-day clearing processing with payment card companies.

2 This field is optional if your CyberSource account is configured for relaxed requirements for address data and expiration date. See "Relaxed Requirements for Address Data and Expiration Date," page 44. **Important** It is your responsibility to determine whether a field is required for the transaction you are requesting.

Table 4 Request Fields (Continued)

Field	Description	Used By: Required (R) or Optional (O)	Data Type (Length)
merchantReferenceCode	Merchant-generated order reference or tracking number. CyberSource recommends that you send a unique value for each transaction so that you can perform meaningful searches for the transaction. For information about tracking orders, see *Getting Started with CyberSource Advanced for the Simple Order API*.	ccAuthService (R)	String (50)
paymentNetworkToken_ assuranceLevel	Confidence level of the tokenization. This value is assigned by the token service provider. **Note** This field is supported only for CyberSource through VisaNet and FDC Nashville Global.	ccAuthService (O)	String (2)
paymentNetworkToken_ deviceTechType	Type of technology used in the device to store token data. Possible value: `001`: Secure Element (SE) Smart card or memory with restricted access and encryption to prevent data tampering. For storing payment credentials, a SE is tested against a set of requirements defined by the payment networks. **Note** This field is supported only for FDC Compass.	ccAuthService (O)	Integer (3)
paymentNetworkToken_ requestorID	Value that identifies your business and indicates that the cardholder's account number is tokenized. This value is assigned by the token service provider and is unique within the token service provider's database. **Note** This field is supported only for CyberSource through VisaNet, FDC Nashville Global, and Chase Paymentech Solutions.	ccAuthService (O)	String (11)
paymentNetworkToken_ transactionType	Type of transaction that provided the token data. This value does not specify the token service provider; it specifies the entity that provided you with information about the token. Set the value for this field to `1`.	ccAuthService (R)	String (1)
paymentSolution	Identifies Apple Pay as the payment solution that is being used for the transaction: Set the value for this field to `001`. **Note** This unique ID differentiates digital solution transactions within the CyberSource platform for reporting purposes.	ccAuthService (R)	String (3)

1 The TC 33 Capture file contains information about the purchases and refunds that a merchant submits to CyberSource. CyberSource through VisaNet creates the TC 33 Capture file at the end of the day and sends it to the merchant's acquirer, who uses this information to facilitate end-of-day clearing processing with payment card companies.

2 This field is optional if your CyberSource account is configured for relaxed requirements for address data and expiration date. See "Relaxed Requirements for Address Data and Expiration Date," page 44. **Important** It is your responsibility to determine whether a field is required for the transaction you are requesting.

Table 4 Request Fields (Continued)

Field	Description	Used By: Required (R) or Optional (O)	Data Type (Length)
purchaseTotals_currency	Currency used for the order: USD	ccAuthService (R)	String (5)
purchaseTotals_ grandTotalAmount	Grand total for the order. This value cannot be negative. You can include a decimal point (.), but you cannot include any other special characters. CyberSource truncates the amount to the correct number of decimal places.	ccAuthService (R)	Decimal (60)
ucaf_authenticationData	Cryptogram for payment network tokenization transactions with Mastercard.	ccAuthService (R)	String (32)
ucaf_collectionIndicator	Required field for payment network tokenization transactions with Mastercard. Set the value for this field to 2.	ccAuthService (R)	String with numbers only (1)

1 The TC 33 Capture file contains information about the purchases and refunds that a merchant submits to CyberSource. CyberSource through VisaNet creates the TC 33 Capture file at the end of the day and sends it to the merchant's acquirer, who uses this information to facilitate end-of-day clearing processing with payment card companies.

2 This field is optional if your CyberSource account is configured for relaxed requirements for address data and expiration date. See "Relaxed Requirements for Address Data and Expiration Date," page 44. **Important** It is your responsibility to determine whether a field is required for the transaction you are requesting.

API Reply Fields

Important

Because CyberSource can add reply fields and reason codes at any time:

- You must parse the reply data according to the names of the fields instead of the field order in the reply. For more information about parsing reply fields, see the documentation for your client.
- Your error handler should be able to process new reason codes without problems.
- Your error handler should use the **decision** field to determine the result if it receives a reply flag that it does not recognize.

Note

Your payment processor can include additional API reply fields that are not documented in this guide. See *Credit Card Services Using the Simple Order API* for detailed descriptions of additional API reply fields.

Table 5 Reply Fields

Field	Description	Returned By	Data Type & Length
card_suffix	Last four digits of the cardholder's account number. This field is returned only for tokenized transactions. You can use this value on the receipt that you give to the cardholder. **Note** This field is returned only for CyberSource through VisaNet and FDC Nashville Global. ***CyberSource through VisaNet*** The value for this field corresponds to the following data in the TC 33 capture file[1]: ■ Record: CP01 TCRB ■ Position: 85 ■ Field: American Express last 4 PAN return indicator.	ccAuthReply	String (4)
ccAuthReply_amount	Amount that was authorized.	ccAuthReply	String (15)
ccAuthReply_ authorizationCode	Authorization code. Returned only when the processor returns this value.	ccAuthReply	String (7)
ccAuthReply_ authorizedDateTime	Time of authorization. Format: YYYY-MM-DDThh:mm:ssZ Example: 2019-08-11T22:47:57Z equals August 11, 2019, at 22:47 (10:47:57 p.m.). The T separates the date and the time. The Z indicates UTC.	ccAuthReply	String (20)

1 The TC 33 Capture file contains information about the purchases and refunds that a merchant submits to CyberSource. CyberSource through VisaNet creates the TC 33 Capture file at the end of the day and sends it to the merchant's acquirer, who uses this information to facilitate end-of-day clearing processing with payment card companies.

Table 5 Reply Fields (Continued)

Field	Description	Returned By	Data Type & Length
ccAuthReply_avsCode	AVS results. See *Credit Card Services Using the Simple Order API* for a detailed list of AVS codes.	ccAuthReply	String (1)
ccAuthReply_ avsCodeRaw	AVS result code sent directly from the processor. Returned only when the processor returns this value.	ccAuthReply	String (10)
ccAuthReply_cvCode	CVN result code. See *Credit Card Services Using the Simple Order API* for a detailed list of CVN codes.	ccAuthReply	String (1)
ccAuthReply_cvCodeRaw	CVN result code sent directly from the processor. Returned only when the processor returns this value.	ccAuthReply	String (10)
ccAuthReply_ paymentCardService	Mastercard service that was used for the transaction. Mastercard provides this value to CyberSource. Possible value: 53: Mastercard card-on-file token service **Note** This field is returned only for CyberSource through VisaNet.	ccAuthReply	String (2)

1 The TC 33 Capture file contains information about the purchases and refunds that a merchant submits to CyberSource. CyberSource through VisaNet creates the TC 33 Capture file at the end of the day and sends it to the merchant's acquirer, who uses this information to facilitate end-of-day clearing processing with payment card companies.

Table 5 Reply Fields (Continued)

Field	Description	Returned By	Data Type & Length
ccAuthReply_ paymentCardService Result	Result of the Mastercard card-on-file token service. Mastercard provides this value to CyberSource. Possible values: ■ C: Service completed successfully. ■ F: One of the following: • Incorrect Mastercard POS entry mode. The Mastercard POS entry mode should be 81 for an authorization or authorization reversal. • Incorrect Mastercard POS entry mode. The Mastercard POS entry mode should be 01 for a tokenized request. • Token requestor ID is missing or formatted incorrectly. ■ I: One of the following: • Invalid token requestor ID. • Suspended or deactivated token. • Invalid token (not in mapping table). ■ T: Invalid combination of token requestor ID and token. ■ U: Expired token. ■ W: Primary account number (PAN) listed in electronic warning bulletin. **Note** This field is returned only for CyberSource through VisaNet.	ccAuthReply	String (1)
ccAuthReply_ processorResponse	For most processors, this is the error message sent directly from the bank. Returned only when the processor returns this value.	ccAuthReply	String (10)
ccAuthReply_reasonCode	Numeric value corresponding to the result of the credit card authorization request. See *Credit Card Services Using the Simple Order API* for a detailed list of reason codes.	ccAuthReply	Integer (5)
ccAuthReply_ reconciliationID	Reference number for the transaction. This value is not returned for all processors.	ccAuthReply	String (60)

1 The TC 33 Capture file contains information about the purchases and refunds that a merchant submits to CyberSource. CyberSource through VisaNet creates the TC 33 Capture file at the end of the day and sends it to the merchant's acquirer, who uses this information to facilitate end-of-day clearing processing with payment card companies.

Table 5 Reply Fields (Continued)

Field	Description	Returned By	Data Type & Length
ccAuthReply_ transactionQualification	Type of authentication for which the transaction qualifies as determined by the Mastercard authentication service, which confirms the identity of the cardholder. Mastercard provides this value to CyberSource. Possible values: ■ 1: Transaction qualifies for Mastercard authentication type 1. ■ 2: Transaction qualifies for Mastercard authentication type 2. **Note** This field is returned only for CyberSource through VisaNet.	ccAuthReply	String (1)
ccAuthReversalReply_ paymentCardService	Mastercard service that was used for the transaction. Mastercard provides this value to CyberSource. Possible value: 53: Mastercard card-on-file token service **Note** This field is returned only for CyberSource through VisaNet.	ccAuthReversal Reply	String (2)

1 The TC 33 Capture file contains information about the purchases and refunds that a merchant submits to CyberSource. CyberSource through VisaNet creates the TC 33 Capture file at the end of the day and sends it to the merchant's acquirer, who uses this information to facilitate end-of-day clearing processing with payment card companies.

Table 5 Reply Fields (Continued)

Field	Description	Returned By	Data Type & Length
ccAuthReversalReply_ paymentCardService Result	Result of the Mastercard card-on-file token service. Mastercard provides this value to CyberSource.
